

MaizeKing

Forage Preservative

A NEW APPROACH TO PRESERVING MAIZE SILAGE

BioStart MaizeKing has been specially developed in New Zealand for farmers to promote maize silage preservation.

MaizeKing consists of a blend of fermentation extracts and nutrients that have a dual mode of action to preserve feed quality: it activates the beneficial bacteria that occur naturally on maize to produce ensiling lactic acid and acetic acid, and it inhibits the yeasts and moulds responsible for decomposition and spoilage.

MaizeKing Liquid or Granules formulation is conveniently stored at room temperature (below 30°C). MaizeKing Liquid does not require dilution prior to application.

MaizeKing Liquid and Granules are easily applied through one of our custom Liquid or Granule Applicators. Our sales team will help you choose the correct applicator to suit your needs.

Benefits

- Stored at room temperature
- Apply straight from the drum
- Easy to apply
- Increased palatability
- Increases harvest / baling window

Application Rates

MaizeKing Liquid: 115 mL/wet tonne of forage

Granules: 130 g/wet tonne (for pit silage)

Always use MaizeKing in conjunction with good silage making practices.

MaizeKing Liquid is available in 20 L and 1,000 L containers, or as Granules in 20 kg bags
